

1 which are the longer lesion patients, the ones that  
2 real need it as a bail out, and maybe that is  
3 something you could use to get the thing approved.

4 DR. LASKEY: At risk of being redundant, I  
5 share everyone's comments to date. We appreciate  
6 the effect that went into this. We appreciate your  
7 energy in hanging with it, in what was clearly an  
8 avalanche of reticence on the panel's part. I  
9 think that there is a need for a device that you  
10 can reach for when you are in trouble, and I wonder  
11 out loud whether it is possible to construct a  
12 reasonably statistically meaningful registry of  
13 abrupt and threatened closure to make your case a  
14 little stronger.

15 But backing into it this way, backing off  
16 from a study which did not have its desired  
17 endpoint reached because of reticence on the part  
18 of investigators and so forth, and then again doing  
19 a post hoc retrospective look at a different  
20 definition I think all conspired against you. But  
21 it is important to proceed here and give clinicians  
22 a useful bail-out device, and I would think that a  
23 properly conducted registry with a good look, a  
24 very stringent look at threatened closure may help  
25 the cause.

1 DR. FREISCHLAG: Mu concern is I am not  
2 sure PTA or stents are any better than the natural  
3 history of the disease, and to convince me that  
4 this isn't hurting people longer data is needed to  
5 know that at two, three and four years if these  
6 things go down, they don't get worse. I know as a  
7 surgeon, when I do a fem/pop and it goes down a lot  
8 of my patients get worse when the bypass goes down  
9 because of the lack of collaterals. And, I am  
10 really concerned that nine months in my mind isn't  
11 long. These patients do live about five years and  
12 I think we need to look at them in a long-term  
13 piece and probably have a different analysis to  
14 convince me that they will be okay in the long  
15 term.

16 DR. DEWEESE: I believe the original  
17 motion was that with the information we had today  
18 that I should vote, and for that reason I voted  
19 that we not approve but I would have accepted a  
20 motion that said approved with if they had given us  
21 all the information we asked for today. But I said  
22 what I said.

23 DR. ROBERTS: I guess the only thing that  
24 I would say is that I really congratulate the  
25 sponsors on sticking with this trial, and I

1 understand how difficult this is. I would also say  
2 to the investigators that it is so sad that you  
3 decided not to do the patients that really needed  
4 to be done because I think if you had done the  
5 really difficult lesions you probably would have  
6 found that, in fact, the stents might have worked  
7 and would have shown a benefit. And, I would be  
8 very hopeful and encouraging for that data, if it  
9 exists, to be brought back, wherever it comes from,  
10 and used as data to help support the fact that in  
11 lesions that perhaps were not the lesions that were  
12 studied in this group, which were the very short  
13 lesions, the lesions that PTA is going to do okay  
14 with instead of studying the tough ones which might  
15 have shown a benefit, and that is unfortunate.

16 DR. TRACY: Mr. Jarvis, did you have any  
17 comments that you would like to make?

18 MR. JARVIS: No.

19 DR. TRACY: Then, I think that ends this  
20 portion of the meeting and I also would like to  
21 thank the sponsor and applaud their effects for  
22 putting together this very, very difficult trial,  
23 and wish you luck in your future endeavors with  
24 this.

25 We are going to shift gears a little bit

1 here and be discussing at this point clinical study  
2 design issues for iliac stenting. You might want  
3 to wiggle in your chair a little bit but I think we  
4 will keep pressing on here and I will call this to  
5 order and invite the FDA presentation.

6 **Clinical Study Design Issues for Iliac Stenting**

7 MS. DANIELSON: We have some really  
8 important questions here and, in light of what we  
9 have just seen, the difficulty of doing randomized  
10 trials when we have rampant off-label use of  
11 stents, I am going to limit some of the slides and  
12 questions that I am going through here.

13 [Slide]

14 One of the things that I want to emphasize  
15 is that right now there are only two stents  
16 approved for the iliac artery, and they are both  
17 for suboptimal angioplasty. The first stent was  
18 approved in '91 and the second stent was approved  
19 in '96.

20 Currently, ongoing studies are randomized  
21 trials and they are proceeding very slowly. Some  
22 of the limitations of these trials for why they are  
23 proceeding so slowly appear to be that they are  
24 randomized; they are using the currently approved  
25 stents that are approved for iliac arteries as the

1 controls and there are limitations with these  
2 stents and the availability of other stents for  
3 off-label use.

4 [Slide]

5 The first question is, given our current  
6 understanding of stenting the iliac artery  
7 following suboptimal angioplasty, please discuss  
8 the need for a randomized control trial to evaluate  
9 a new iliac stent system for a suboptimal  
10 indication.

11 [Slide]

12 I am going to go right to question four.  
13 This addresses the primary stent for the iliac  
14 artery. Given our current understanding of  
15 stenting in iliac arteries over the past ten years,  
16 please discuss the following points regarding the  
17 trial design for a primary stent indication: Is a  
18 randomized trial necessary? What are the  
19 appropriate controls? Should a primary stent trial  
20 require a superiority-based hypothesis? Is an  
21 equivalence hypothesis acceptable? And, what are  
22 the appropriate endpoints? And, any additional  
23 comments would be appreciated by FDA. Thank you.

24 DR. TRACY: All right. We are going to,  
25 at this point, allow the open public hearing. I

1 know there are a number of people who are waiting  
2 to make some presentations this afternoon.

3 **Open Public Hearing**

4 MS. MOYNAHAN: We will have Chris White,  
5 and if you could just state for the record any  
6 conflict of interest issues, including whether your  
7 travel was paid for, or whether you are an  
8 investigator in an iliac trial.

9 DR. WHITE: My name is Chris White. I am  
10 a clinical cardiologist at the Ochsner Clinic, in  
11 New Orleans. My travel is, hopefully, going to be  
12 paid for by the ACC, the American College of  
13 Cardiology, but that has not been settled. I am  
14 here with that expectation.

15 [Laughter]

16 I should say that today I was asked to  
17 come by Dr. Rosenfield, who is the Chairman of the  
18 Peripheral Vascular Disease Committee of the ACC,  
19 because I have a large practice in peripheral  
20 vascular intervention. It makes up about a third  
21 of our practice. There is a group of four of us  
22 who do about 3000 interventions a year, and about  
23 one third of that is peripheral. We are involved  
24 in many of the current clinical trials, both in  
25 coronary and peripheral, and are very familiar with

1 the difficulties that the panel faces and we face  
2 as clinicians waiting for devices to come to us.

3 [Slide]

4 I am actually going to propose some  
5 radical issues today. Some I feel are true; some  
6 maybe we will just try to be provocative about.

7 [Slide]

8 The first issue I wanted to raise, and I  
9 heard this actually this morning, is that the  
10 terminology is really difficult, and I think Dr.  
11 Laskey actually mentioned this. It gets very  
12 confusing in the peripheral vasculature trying to  
13 understand what the indications are and what we are  
14 talking about.

15 I would propose that we talk about primary  
16 stent placement and provisional stent placement.  
17 The term suboptimal has been used a lot this  
18 morning but the trouble with suboptimal is that it  
19 is very subjective. Primary stent placement means  
20 that you are going to end up with a stent  
21 regardless of what the result with pre-dilatation  
22 or preparation of the artery is, and I think that  
23 is a special category of patients. In fact, it may  
24 be a surprise to you to know that about 90 percent  
25 of all the peripheral interventions that are

1 performed in the country today -- maybe more than  
2 90 percent -- are done in this category, that is,  
3 primary stent placement. We may do them under the  
4 umbrella of provisional but everybody intends to  
5 finish with a stent. So, primary stent placement  
6 is the way we practice. It has been responsible  
7 for the explosion of the clinical procedures that  
8 are being done.

9           Provisional stent placement is maybe more  
10 cost effective and maybe more attractive. That is,  
11 can you get away with balloon dilatation alone? In  
12 one category of patients can we use balloon  
13 angioplasty alone? And, in one setting should the  
14 stent be used to support balloon angioplasty?

15           You heard this morning a trial based, or  
16 at least some data based around suboptimal stent  
17 placement. It would also go toward unfavorable  
18 anatomies. For example, typically a long, totally  
19 occluded iliac lesion would not even be a candidate  
20 for balloon angioplasty. So, you would be planning  
21 to use provisional stenting for that lesion from  
22 the git-go.

23           [Slide]

24           One of the radical concepts I would like  
25 to propose is that you would consider stents only

1 in two categories. You would consider stents in a  
2 coronary category and non-coronary category. I  
3 believe that it is reasonably difficult to conceive  
4 approval of stents for every named vessel in the  
5 body, and that we would have a debate about a  
6 vascular device salvaging an interventional  
7 procedure in the SFA with a popliteal or renal or  
8 subclavian or brachial or an axillary. Really, if  
9 you insist on doing that, then what you insist on  
10 doing is making most of us practice in the current  
11 manner, which is off-label use.

12 I believe that we can talk about specifics  
13 of target vessel issues, and certainly renal is  
14 different than a leg; brain is different than the  
15 kidney. But, I do believe that we are talking  
16 about ischemia to an end organ and we are talking,  
17 particularly in the suboptimal indication or the  
18 provisional indication, about salvaging a balloon  
19 angioplasty. So, if the indication for balloon  
20 angioplasty is met which is not what we are  
21 approving, we are approving the stent, and balloon  
22 angioplasty is insufficient for whatever reason,  
23 then a stent to support that indication really goes  
24 past the end organ in which the stent is being  
25 used.

1 I would support that argument by listing  
2 for you the number of coronary applications that I  
3 use approved stents for, but no one would ever  
4 consider a trial for a bifurcation lesion, for  
5 example. We do not have specifically approved  
6 stents for total occlusions, for bifurcations, for  
7 vein grafts. The list is endless where we put  
8 approved stents once we have an idea. And, I think  
9 that non-coronary applications would lend  
10 themselves to this, although it really goes against  
11 the current stream of thinking.

12 The second thing is that it would bring  
13 some consistency to this field of terrible  
14 inconsistency, and that is that stents, balloons,  
15 filter devices, other peripheral devices could all  
16 be considered in the same way. Sponsors and  
17 physicians alike could have some idea of what the  
18 ground rules were for coming to some idea of  
19 acceptability.

20 [Slide]

21 As I mentioned to you, I think it is not  
22 possible to approve for every named vessel. We  
23 talked about the indications. I think that we  
24 could approve these devices for non-coronary use  
25 and it would be at the physician's discretion to

1 use these stents in a non-coronary bed for the  
2 approved indication. What I mean is that if I am  
3 going to use this stent as a bail out or as a  
4 suboptimal or as a provisional stent, that would be  
5 my decision to use that stent in the popliteal or  
6 the iliac or the renal, but you would decide  
7 whether this was a reasonable stent for a bail out  
8 indication, not specifically the artery for which  
9 it was approved. Of course, you could approve it  
10 and you could say I like this stent for everything  
11 but ... and you could list limitations.

12 I can tell you that there is going to be a  
13 day when there will be approved carotic stents, and  
14 some of those stents are going to be very nice for  
15 use in other parts of the body. So, you will have  
16 an approved carotid stent that I will use as an  
17 off-label maybe below the knee, maybe in the  
18 popliteal. So, the point would be you could decide  
19 that you don't think this stent does very well in  
20 any end organ and you could approve it with those  
21 limitations.

22 [Slide]

23 I think it is difficult to do randomized  
24 trials. You have all heard that this morning.  
25 When the control group is clinically unattractive,

1 even though the science is excellent, the trial  
2 won't get done. I cannot randomize patients to a  
3 clinically unattractive subgroup.

4           The other problem is that when the  
5 unapproved devices -- I shouldn't say unapproved,  
6 when the approved but off-label devices are  
7 superior to the currently approved devices it is  
8 very difficult to randomize to the old technology  
9 and put my patient at some disadvantage or some  
10 risk.

11           I think that randomization is still  
12 suitable for primary stenting indications, and that  
13 was the purpose of the original trial this morning.  
14 That is, if I am going to put a stent in for a  
15 long-term patency indication, I do believe that  
16 randomization is appropriate.

17           [Slide]

18           When we look at non-randomized trials, the  
19 literature supports a very high success rate and  
20 low complication rate for iliac procedures. I  
21 think we have a long ten-year history of these  
22 devices and we can look at what is acceptable.

23           I think registry data and data with  
24 performance objectives offer the opportunity to  
25 look at real-world data versus the artificial world

1 of randomized trials. We pride ourselves on some  
2 randomized trials and, yet, our patient population  
3 does not fit the randomized trial data. Registry  
4 data allows us to put these devices into regular  
5 patients that we see every day and to look and  
6 collect that meaningful data about real-world use.

7 Of course, we have a good amount of  
8 historical control data in many of these subsets in  
9 order to create meaningful objective criteria.  
10 Again, I believe that non-randomized trials are  
11 more suitable for the provisional stent indication.

12 [Slide]

13 The endpoints for provisional stent  
14 placement I would suggest would be procedural  
15 safety and efficacy, to be defined by the sponsor  
16 and the committee. Thirty-day safety and efficacy  
17 numbers should be collected in the provisional  
18 stent placement category, but I would not insist on  
19 any longer formal follow-up than 30 days when we  
20 talk about salvaging a failed angioplasty because I  
21 think we make no commitment in that trial to  
22 provide an enhanced long-term outcome. We are  
23 simply saving the day and we should evaluate the  
24 device for that purpose.

25 On the other hand, I would like to make

1 sure, just as I believe one of the panel members  
2 suggested today, that bad things don't happen at  
3 late follow-up. So, I believe that postmarket  
4 surveillance should be seriously used at some late  
5 date to look at repeat procedures and limb salvage,  
6 particularly for the iliacs, and that primary stent  
7 placement would also include at least six-month  
8 follow-up -- duplex, ultrasound ankle brachial  
9 index. I don't believe there is a big tail-off in  
10 stent patency after six months and I think that  
11 would be a reasonable time.

12 [Slide]

13 I think that primary stent trials are  
14 difficult. There is currently no approved stent,  
15 yet it is the most commonly performed procedure in  
16 iliacs today. We don't really have anything to  
17 compare. It is not possible to do a head-to-head  
18 trial because the only approved stents are for  
19 suboptimal or provisional stenting. So, it really  
20 isn't possible to do a primary stent implantation  
21 in the iliacs as a head-to-head trial until we get  
22 an approved stent for that indication. I think  
23 patency at six months is adequate. I would look at  
24 safety at 30 days, and I would be serious about  
25 postmarket surveillance for late complications.

1           Again, I think it might be appropriate to  
2 randomize primary with an experimental stent for  
3 provisional indications for the approved stent.  
4 That would be I think appropriate.

5           [Slide]

6           I think it is very important that the  
7 committee keep in mind fast-track approvals for  
8 life-saving devices. It sometimes is very  
9 difficult to get devices through the system that  
10 have a small market value but which would save  
11 lives. I am specifically talking about things like  
12 covered stents in the iliacs for big tears and  
13 retroperitoneal bleeding. These devices should be  
14 accelerated and pushed through the approval process  
15 to get them into clinicians' hands.

16          [Slide]

17          I think the committee ought to consider  
18 seriously surrogate endpoints, particularly for  
19 distal embolization devices. I think it is a good  
20 thing to prevent distal emboli, and I think that  
21 efficacy ought to be equivalent to debris  
22 retrieval. Distal embolization is clearly harmful.  
23 It is just a matter of degree how harmful it is.  
24 And, I would believe that registry data with  
25 objective performance criteria would suffice for

1 adequacy as opposed to a huge trial demanding some  
2 clinical endpoint improvement.

3 That is all I have. Thank you for your  
4 attention.

5 DR. ANSEL: I am Gary Ansel again, and the  
6 disclosures are the same as before.

7 I am going to make this nice and brief,  
8 with no slides. One of the things that does come  
9 up a lot on committee discussions about using  
10 angioplasty and stents and things is long-term  
11 patency. Oftentimes there is mention of surgical  
12 patency versus stenting patency. What I guess I  
13 want to bring to your attention is that these are  
14 two vastly different procedures. With the  
15 downsizing of these percutaneous procedures, the  
16 closure devices that are now available, as you can  
17 see the complication rates of these outpatient  
18 procedures are extremely low.

19 I think that assisted patency, whether it  
20 be two or three procedures, at two to three years  
21 is what we should be looking at in concert with the  
22 patient's complications -- their survivability,  
23 their functionability and whether or not they are  
24 in a nursing home or independent living.

25 That is all I am going to bring up. Thank

1 you.

2 DR. ROSENFELD: I want to thank Chris for  
3 coming up today. It is a long haul from New  
4 Orleans. He is really respected within the  
5 vascular community in general. That applies to  
6 surgery, radiology, cardiology -- people that  
7 perform vascular interventions.

8 I also just want to make an aside comment  
9 about this morning. I think the panel also  
10 deserves a lot of credit for getting this huge sum  
11 of data and having to process that and figure out  
12 whether a device should be approved or not. That  
13 is going to be a huge task, I guess.

14 I guess the first thing to say is that I  
15 wrote up a letter to Dr. Doug Zipes, who is the  
16 current president of the American College of  
17 Cardiology. And, as the Chairman of the Peripheral  
18 Vascular Disease Committee, I took it upon myself,  
19 having met Megan about three weeks ago and  
20 realizing that this open session was going to  
21 occur, I took advantage of that and asked my  
22 colleagues to come and help offer some of our own  
23 thoughts. So, I appreciate the panel's  
24 receptiveness to those thoughts.

25 In that spirit, I put together a letter

1 that I wrote to Dr. Zipes that I thought summarized  
2 some of our feelings about these issues which are  
3 very difficult for us as clinicians and you as a  
4 panel to have to wrestle with. Chris, I think,  
5 summarized what the content of my letter is very  
6 nicely. That has been distributed to all the panel  
7 members. No? It didn't get around.

8 MS. MOYNAHAN: It wasn't collated, but it  
9 went to the most important people, which are the  
10 transcriptionist and the summary writer. It will  
11 make it into the record.

12 DR. ROSENFELD: Well, I could take this  
13 time to read this. I am not sure that you want  
14 that, but it might be better to more effectively  
15 distribute it to the panel members for their post  
16 hoc review. It is up to you.

17 MS. MOYNAHAN: Do you want to touch on  
18 just some of the most important points while we  
19 finish collating that?

20 DR. ROSENFELD: Sure, if you will bear  
21 with me because I didn't put slides together. With  
22 all that has gone on over the past 24 hours I  
23 didn't actually have a chance.

24 The intent was to answer some of your  
25 specific questions about iliac stents. Just to

1 focus in on the iliac stenoses, I too share Dr.  
2 Laskey's concern about sort of rampant, widespread  
3 stenting for every and any indication regardless of  
4 whether there is any appropriate data to support  
5 that. So, everything that I say is taken in that  
6 light.

7 On the other hand, I think that there has  
8 been a tremendous change over the past five years  
9 where clinicians that are in practice realize that  
10 stenting really has very little downside, and the  
11 potential of a failed balloon angioplasty, whether  
12 it is acute or subacute, has a huge downside.

13 We would be concerned if we had problems  
14 within stents. If there was a high rate of  
15 infection -- I think that was one of the biggest  
16 concerns early on, or if there is a high rate of  
17 thrombosis of stents in any given venue. It turns  
18 out that that is not the case. So, to me, as a  
19 clinician who is in practice. I am trying to do  
20 the best thing for my patient.

21 Then the question comes up is it possible  
22 to randomize patients between primary stenting  
23 versus balloon angioplasty when you are faced with  
24 a patient who has what you think is a suboptimal  
25 result and you think in your heart of hears that

1 this my father or my mother on the table, would I  
2 leave this result alone? And, you say to yourself  
3 no, I wouldn't. Do I have a stent available? Yes,  
4 I do. Okay, then you go ahead and you put the  
5 stent in.

6 Now, that doesn't happen to every patient,  
7 and I don't think that the impression should be  
8 given to this panel that that happens to every  
9 patient, but it does present a real problem for  
10 clinicians. Actually, Dr. Zipes made the  
11 commentary in his response to me, which is  
12 attached, that the situation was similar with RF  
13 ablation where there was a difficulty in doing  
14 randomized controlled trials because we had a  
15 technology and it didn't make sense to randomize  
16 those patients because the technology was so much  
17 better that you didn't want to compromise your own  
18 individual patient's position.

19 So, do I think that randomized controlled  
20 trials are appropriate and necessary for getting  
21 approval for stents in iliac stenoses? No, I would  
22 say that I would divide this up, like Chris did,  
23 into provisional stenting. I think there should be  
24 the ability to get an approval for provisional  
25 stenting, that is, for a suboptimal result of

1 balloon angioplasty, however you might define that,  
2 and that that approval should be able to be based  
3 on historical controls. I think it is possible.  
4 It is not easy to come up with those historical  
5 controls and to develop a set of OPCs, but I think  
6 that that is the hard work that should probably be  
7 done because those of us who are now faced with  
8 these trials, as Ms. Danielson outlined, are faced  
9 with trying to enroll patients in trials -- we are  
10 faced with randomizing them to an outdated stent,  
11 an outdated technology with probably not as good  
12 results in the long term or even in the short term;  
13 probably not as safe a profile as the current  
14 stents against which we are randomizing them to.

15           So, the bottom line is that I think that  
16 it is probably not reasonable to ask industry to  
17 then ask clinicians to randomize the newer stent  
18 technology against outdated technology. There are  
19 only two stents approved for use in iliac arteries,  
20 and those were approved many, many years ago.  
21 There is a huge revolution in technology that makes  
22 the current devices much more favorable.

23           That was a long-winded answer. So, my  
24 position would be that I don't think we have to  
25 randomize against older technology. I think we

1 should be able to perform registries of newer  
2 stents for the provisional indication and develop a  
3 set of OPCs that would be acceptable for that.

4 Now, what about primary stenting as  
5 opposed to provisional stenting? I think that, on  
6 the other hand, deserves a longer term trial to  
7 demonstrate efficacy as opposed to the case of  
8 provisional stenting. I have expounded upon that  
9 in the letter that I wrote here.

10 What about iliac occlusions? I think that  
11 the practice of primary stenting for iliac  
12 occlusions is a widespread practice. It is  
13 probably a rare event that the iliac occlusion that  
14 is revascularized with balloon alone doesn't have a  
15 5 mm residual gradient or a residual 50 percent  
16 stenosis. In other words, most of those patients  
17 already qualify for the suboptimal balloon result  
18 based on the previously approved stents --  
19 WallStent and Palmaz stent. So, more than 95  
20 percent of revascularized iliac occlusions will  
21 already satisfy those criteria. So, I don't  
22 believe it is appropriate to randomize those  
23 patients against balloon angioplasty alone. I  
24 think that is doing our patients a disservice.

25 So, given the fact that the safety profile

1 of placing these metallic structures in the iliac  
2 artery is pretty high, that is not really in  
3 question. The real question is what is the  
4 complication rate in terms of distal embolization  
5 and can you get a good acute result in those  
6 patients given that there is already a suboptimal  
7 outcome by definition? So, I would not support a  
8 position where you need to look at these patients  
9 in quite so long term a fashion because you are  
10 already talking about, in a majority of these  
11 patients, a suboptimal result.

12           So, you might say, well, why not compare  
13 them to surgery as another endpoint? These  
14 patients could have an aortal-femoral bypass. That  
15 is really the thing against which maybe you should  
16 compare them. I agree with Dr. Ansel that there is  
17 a real huge difference in the surgical approach.  
18 One is a major intervention and the other is not as  
19 major an intervention. One is easily retreated for  
20 restenotic lesions; the other is a much more  
21 difficult thing to retreat. And, the performance  
22 of the balloon angioplasty and stenting doesn't  
23 necessarily preclude the opportunity to intervene  
24 surgically at a later date. So, what are we losing  
25 by allowing a strategy of primary stenting in iliac

1 occlusions? I don't think much as long as the  
2 safety profile is good.

3           So, what I would argue for is looking very  
4 closely at safety endpoints and acute patency  
5 endpoints, say at 30 days in the case of iliac  
6 occlusions. I mean, I think this is something that  
7 should be open for discussion amongst clinicians  
8 and FDA and others that are involved in treating  
9 these patients, and industry who faces the real  
10 problem of how to get devices to market which we  
11 think are much better than the current devices that  
12 are out there and that the clinicians are clamoring  
13 for and patients are clamoring for. But we have  
14 this huge hurdle that we have to surmount and it is  
15 a real problem that I think should be open for  
16 discussion and resolution. Thank you.

17           DR. LASKEY: I just have one question for  
18 Ken. When we are talking about iliac, are we  
19 talking about iliac or are we going into  
20 iliofemoral, popliteal? What specifically are you  
21 referring to? Because in my mind, I didn't think  
22 there was an issue iliac.

23           DR. ROSENFELD: Actually, the questions  
24 that the FDA asked were specifically related to  
25 iliac. Chris proposed this notion that you approve

1 stents for non-coronary and coronary applications,  
2 and I think what I outlined in my letter is a  
3 little bit different from that and it acknowledges  
4 that each vascular bed -- certain vascular beds you  
5 can sort of subset them and they have their own  
6 particular issues. Dr. DeWeese and I sort of met  
7 in the corridor this morning and talked a little  
8 bit about the issue of compression and the adductor  
9 canal and the specific issues that one has to deal  
10 with in the femoropopliteal access, and I think  
11 that is a special area that you need to sort of  
12 segregate out a little. So, I will disagree a  
13 little bit with Dr. White's comments in that  
14 regard.

15           On the other hand, I agree with him  
16 insofar as how are you going to get a stent  
17 approved for subclavian stenoses? I mean, I can  
18 tell you that subclavians do much better with  
19 stenting but you are never going to accumulate a  
20 trial of 200 or 300 subclavian patients randomized  
21 to balloon versus stenting. You are just never  
22 going to get there. So, does that mean we should  
23 never have a stent that is approved for the use in  
24 the subclavian arteries? No, I don't think it  
25 does. Subclavian is pretty much like the iliac in

1 terms of the bed it serves, although you do have  
2 the vertebrae so you have issues of safety that  
3 have to be addressed. You have to make sure that  
4 you are not going to embolize to the vertebral.  
5 But, aside from that, as long as you can get the  
6 job done safely and you create a nice hemodynamic  
7 result, those stents really fall in the same  
8 category as the iliac. So, I would be in favor of  
9 a registry for subclavian approval based on the  
10 performance we know of these same stents to be in  
11 the iliac arteries.

12 Now, carotids I think are a different  
13 situation. It is a little bit dependent on the  
14 blood that you are serving, and the cerebral  
15 vascular bed is special in its own right for a lot  
16 of reasons, and there are randomized trials already  
17 defined to address that.

18 The renal vascular bed I also think is a  
19 little bit of a unique bed. So, I would segregate  
20 things in that way, sort of femoropopliteal, aorta-  
21 iliac -- that is another one, the aorta. You are  
22 never going to find enough patients to stent the  
23 distal abdominal aorta in a randomized controlled  
24 fashion to be able to gain an indication for that.  
25 But do I think that stenting of the distal

1 abdominal aorta is better than balloon angioplasty  
2 alone? Absolutely. I wouldn't do it without it.  
3 I don't know if that answers your question, Dr.  
4 Laskey.

5 MR. DILLARD: I might just make a comment  
6 on this based on Dr. Rosenfield's comments. I am  
7 not sure, based on that last thing that you just  
8 said whether you are now a lumper or a splitter,  
9 but I will leave that maybe for a minute.

10 The main reason I think we wanted to focus  
11 on iliac here, even though this morning and  
12 afternoon was certainly dedicated to a little bit  
13 different discussion, is that that is predominantly  
14 where we have seen most of the clinical trials that  
15 have been focused on this particular area of the  
16 anatomy. It seems to be where we have the most  
17 investigations, not that it is the only place, and  
18 it is the one where we have real live issues with  
19 sponsors right now, their trial designs and their  
20 enrollment. And, if part of our job at the agency  
21 is to try to help stimulate doing clinical trials  
22 and trying to move them to fruition, this is an  
23 area that is particularly problematic, not that  
24 some of the others are not.

25 Further, and this is the last comment I

1 will make, is go ahead and focus today on iliac but  
2 it is probably not the last time we will talk about  
3 this particular area of vasculature and clinical  
4 trial designs. I am sure potentially we could get  
5 to the point where we could have a much broader  
6 discussion about a broad array of vascular beds and  
7 how that might affect stenting and particular trial  
8 designs. So, I appreciate your comments very much.

9 DR. ROSENFELD: Can I just respond to  
10 that? What I was trying to get at is that I am a  
11 partial lumper but I am also a partial splitter. I  
12 don't know what the answer to this is, but I think  
13 that it requires a discussion of enlightened  
14 participants, panel members who are clinicians as  
15 well and very savvy as to the issues here, and  
16 clinicians such as Chris White and prominent folks  
17 like that, Gary Ansel, and then you folks and  
18 industry to sort of hash out what are the divisions  
19 that are appropriate. I mean, is it appropriate to  
20 consider renals as a separate thing; carotids as a  
21 separate thing? Subclavians could gain approval  
22 provided they have good safety data based on the  
23 fact that iliacs, you know, are the same devices,  
24 the same sizes. I think we can talk about where  
25 you lump and where you split and while today's

1 issues were focused on the iliac, to me it would  
2 seem appropriate and reasonable for the panel, as a  
3 group that is supposed to represent the interests  
4 of patients and furthering patient care, to take on  
5 this issue and wrestle with it in a prospective,  
6 forward looking fashion rather than get stuck in a  
7 situation where, hey, we can't get these trials  
8 done because nobody is enrolling because they have  
9 protocol stents, or whatever reason.

10 DR. WHITE: Let me just say one thing.  
11 The other thing about iliacs that I think is  
12 critical is that you have lost control -- not you  
13 personally, but we have lost control. Every iliac  
14 stent going into patients today has not gotten FDA  
15 approval in the vessel. It is great for biliaries  
16 and I am using it because I think it is true. But  
17 I think it is very important we recognize the  
18 facts, and the facts are you can say we are going  
19 to approve iliacs and we can focus on iliacs but  
20 remember that then the iliacs will become the  
21 surrogate for every other vessel in the body, which  
22 is okay with me because right now the biliary  
23 serves as a surrogate for every other vessel in the  
24 body. So, I think we are moving ahead if we get to  
25 the iliacs. That is good. But remember that we

1 are talking about the vascular distribution. Ken  
2 and I can work out our little differences between  
3 how much we lump and split, but the point is that  
4 it is very important that we find a way to bring  
5 the devices into the vasculature for approval so  
6 that we are sort of decriminalizing the clinicians  
7 out there who are being now forced to sort of make  
8 this end run. The industry is being forced to make  
9 that. So, I think it is important that we find  
10 workable solutions for doing the trials, and that  
11 is what I think this is about.

12 DR. ROBERTS: Can I just ask a quick  
13 question, Dr. White? Why would you even have  
14 coronaries separated out --

15 DR. WHITE: By size.

16 DR. ROBERTS: Really, if you are going to  
17 talk about a vessel as a vessel, you know, they are  
18 not very smart these vessels. They all respond  
19 kind of the same way.

20 DR. WHITE: There is a major size  
21 differential.

22 DR. ROBERTS: Well, the tibial vessels are  
23 basically the same as the coronaries.

24 DR. WHITE: Which vessel?

25 DR. ROBERTS: The tibials.

1 DR. WHITE: Actually, in the tibials we  
2 use coronary stents.

3 DR. ROBERTS: That is what I am saying.

4 DR. WHITE: I believe size is the primary  
5 discriminator for stent performance.

6 DR. ROBERTS: I am not trying to be  
7 confrontational; I am just trying to figure out how  
8 you are defining when you might pick one or  
9 another.

10 DR. WHITE: I think there is no way that  
11 we are ever going to be able to solve the lumping  
12 and the splitting problem. You know, Solomon is  
13 long gone. So, what we have to do is come to a  
14 rational way to approach the problem and an  
15 acceptable number of exceptions, and certainly  
16 naming every vessel for approval is not acceptable.  
17 Then, the next step is how much are you willing to  
18 lump and split? And, I presented a very extreme  
19 view of only two categories. Certainly, we could  
20 come up with five. Two is very extreme. I don't  
21 think you can do one because I think coronary  
22 applications have completely different  
23 complications than the peripheral applications. I  
24 think the complication and organ kind of things  
25 lend themselves better that way but I would be

1 willing to talk about three or five groups.

2 DR. TRACY: Can we maybe move along here  
3 to the next presenter, please?

4 DR. STAINKEN: If somebody could put the  
5 slides up, I would appreciate it.

6 [Slide]

7 This is an important moment. I am from  
8 SCVIR and my name is Brian Stainken. ACC and SCVIR  
9 appear fundamental to agree. That is a great  
10 thing. That said, I would have to say that only a  
11 cardiologist could present -- and this is meant  
12 gently and humorously -- that the world consists of  
13 the heart and then everything else.

14 [Laughter]

15 I think that the comments are important  
16 and interesting but, clearly, I use coronary stents  
17 on a daily basis also all over the body. It is the  
18 physical properties of the stent that we are  
19 looking to describe as well as, in the splitting  
20 category, we want to assess what the alternative  
21 procedures are, particularly the surgical  
22 procedures and how they fit into the equation. So,  
23 I suppose at the end of the day I am a splitter.

24 [Slide]

25 As I said, I am representing the Society

1 for Cardiovascular and Interventional Radiology  
2 today. I do have to disclose a few things. First  
3 off, I came here from Baltimore, Maryland so I  
4 don't think I will even bother to submit a travel  
5 claim. I am, however, a consultant with Boston  
6 Scientific and the study administration for the All  
7 graft trial. In addition, I have participated as a  
8 primary investigator in several of the iliac stent  
9 trials, including the Corvita iliac, Symphony and  
10 Memotherm trial.

11 [Slide]

12 We have all discussed the fact that there  
13 are only two stents which have conditional approval  
14 for the peripheral vascular application. Those are  
15 the Palmaz 308, the old balloon-mounted 9-Palmaz  
16 stent which I believe is no longer commercially  
17 available in its originally approved configuration,  
18 and the Yellow Box Iliac Wall stent, which is a  
19 miserable stent to use and is not widely used  
20 anymore.

21 [Slide]

22 Look at the market projections for  
23 peripheral stents. You can see that over the next  
24 four years the exploding market is going to  
25 continue to explode with an anticipated greater

1 than 200,000 stents placed in America by the year  
2 2004.

3 Let's look at peripheral vascular approved  
4 stents -- almost none and it looks like that number  
5 is dwindling further. So what do we do with that  
6 big gap between approved stents and application?

7 [Slide]

8 First off, why don't we use the Palmaz 308  
9 or the Wall stent? It is because it is obsolete  
10 technology at the end of the day. The 308 is no  
11 longer available even and the iliac Wall stent  
12 shortens dramatically because of its steep right  
13 angle. There are problems with wall apposition.  
14 In addition, at a practical level, you can't keep  
15 Yellow Box Wall stents, Blue Box Wall stents and  
16 the other twenty stents that are available in  
17 inventory in most departments. It simply costs too  
18 much money. Then, there is the issue of introducer  
19 size. Most of the newer stents are smaller  
20 introducers and, therefore, at least a theoretical  
21 benefit in terms of the safety profile.

22 [Slide]

23 Why aren't more stents approved? Well,  
24 the bottom line in my opinion is that the malignant  
25 biliary indication is pretty simple and it is

1 inexpensive. Second, the absence of approval for  
2 vascular indication has no clear marketing or sales  
3 impact. It has a huge, as the folks from  
4 IntraTherapeutics will tell you, potential  
5 financial downside risk but what is the upside for  
6 getting peripheral vascular approval right now?  
7 Finally, the third issue is that delays to labeling  
8 approval create situations where you have obsolete  
9 platforms as you are marketing the device and newer  
10 stents have already come on the market following a  
11 faster pathway than your study device.

12 [Slide]

13 So, what are the problems with the iliac  
14 stent trials to date? First, the control devices  
15 are generally not standard of care. They are  
16 obsolete devices. Second, the trial designs in  
17 general, in my opinion, have been overly  
18 complicated. We have been trying to chase too many  
19 data points, resulting in trials that are  
20 unworkable. We have had restrictive anatomic  
21 criteria, generally by the sponsors, in an attempt  
22 to show the device in the best possible light.  
23 And, we have had follow-up requirements that are  
24 all over the place, including such things as  
25 treadmill testing, routine follow-up angiograms

1 which most of us know patients will not submit to,  
2 and duplex scanning for iliac lesions which many of  
3 us would agree can be difficult. Third, the  
4 eligibility criteria are not the standard of care  
5 frequently for these devices, and that is the issue  
6 of primary stenting that we have been discussing.

7 [Slide]

8 So, why is it that many operators to stent  
9 iliac lesions primarily? I think there actually  
10 are some reasonable justifications for that. One  
11 is that it is a one-step intervention. In general,  
12 in most of medicine that is preferable to a multi-  
13 step intervention. Why? It is faster. In the  
14 real world that means you can turn over your suite  
15 quicker. We all know reimbursement is dwindling.  
16 We need to keep the volume moving through the suite  
17 so we can stay in business. But there are  
18 secondary issues that play into speed. Those are  
19 radiation dose, contrast dose, patient discomfort,  
20 etc., etc.

21 Second, it is simpler. There is a very  
22 heterogeneous group of operators practicing iliac  
23 stenting currently. Placing a stent is a fairly  
24 simple procedure to do, certainly simpler than  
25 doing an angioplasty, assessing the result,

1 assessing the gradient, re-intervening generally  
2 with a larger introducer to place the stent. It is  
3 much easier to do the one-step procedure.

4 Stents are generally much more  
5 reproducible than angioplasty. You don't deal with  
6 that downside risk factor, the angst of wondering  
7 whether your angioplasty worked or not, including  
8 late recoil issues.

9 Next, stenting tends to be reliable. It  
10 tends to be dependable. We can all agree that  
11 compared to a perfect angioplasty it may not offer  
12 a great advantage but pretty much every stent  
13 produces a cookie-cutter consistent result.  
14 Finally, stenting reduces or possibly even  
15 eliminates early stent failure or early  
16 intervention failure, if you will.

17 The next issue is one of perception. That  
18 is, many of us perceive that stents are associated  
19 with better early term results, although I agree  
20 that that is yet to be proven.

21 [Slide]

22 What should our objectives be here today?  
23 Well, we want to try to facilitate peripheral  
24 vascular approval. We want to try and close the  
25 gap between approved devices and clinical

1 application. We all agree that it is a bit  
2 ludicrous currently. How do we want to do that?  
3 We want to try to modify trial designs and bring  
4 them into terms that are more consistent with  
5 current data, standard care of practice, and more  
6 flexible in attempt to try to accommodate some of  
7 the changes in technology which are proceeding at  
8 an incredible pace and changes in science.  
9 Finally, we would like to adjust trial designs so  
10 that we can decrease time to market.

11 [Slide]

12 Is there an advantage to randomization? I  
13 think we have all agreed, every presenter here,  
14 probably not. What about literature or historical  
15 controls? Again, those offer all sorts of  
16 opportunities for new problems, including the  
17 definition of an acceptable historical control, the  
18 potential for variable controls for the same class  
19 of devices, and the opportunity for skewing your  
20 data favorably one way or the other.

21 [Slide]

22 So, what about objective performance  
23 criteria? In my opinion, those will help to  
24 simplify or streamline trials by facilitating  
25 enrollment. You can double your enrollment rate off

1 the top because you eliminate your control arm.  
2 Reduce cost to the industry. If we have a  
3 consistent trial superstructure and statistical  
4 model that would be a huge bonus for industry to  
5 work with us in this area. Reduce risk. It would  
6 make this practice fair across the board for  
7 different manufacturers. It would offer us a  
8 consistent, identifiable benchmark with which the  
9 industry folks might be able to assess their own  
10 prototypes and determine whether it is a marketable  
11 device or not. And, it offers the opportunity to  
12 be versatile, respond to changes in the marketplace  
13 and in our scientific understanding.

14 [Slide]

15 The objective performance criteria should  
16 be to clearly identify and define variables  
17 critical for the safe and effective performance of  
18 iliac stent procedures. We should try to quantify  
19 the threshold for acceptable performance and  
20 follow-up, and we have discussed this already this  
21 afternoon.

22 [Slide]

23 I would like to propose, if it is  
24 acceptable to you, that a SCVIR-FDA device forum  
25 might be an appropriate vehicle to develop a

1 prototype document of this sort.

2 [Slide]

3 In conclusion, the development of clearly  
4 defined and detailed objective performance criteria  
5 for iliac stent procedures will simplify clinical  
6 trial design and reduce clinical trial cost and  
7 risk to the manufacturer. That is how we get their  
8 buy-in. Objective performance criteria will also  
9 produce more useful comparative data between stent  
10 platforms. Finally, by streamlining the approval  
11 process we create an opportunity to realign device  
12 indications and applications in the iliac arterial  
13 tree. Thank you.

14 DR. TRACY: Thank you. Are there any  
15 other comments anybody wants to make in this part  
16 of the open public hearing?

17 MS. PETERSON: As I was sitting here,  
18 listening to everyone, I am not a proponent of  
19 repeating things for the sense of doing them and  
20 reinventing wheels, and just as food for thought,  
21 recently vascular grafts were reclassified to Class  
22 II. To Dr. Roberts' point, they are dimensionally  
23 based; they are not indication or anatomical  
24 location based. So, is there a pattern of another  
25 way to get procedures on the market, such as

1 stents, where we have a vehicle through the agency  
2 that we could mimic and maybe really streamline  
3 this for everybody?

4 DR. TRACY: Thank you. Any other  
5 comments?

6 DR. ROSENFELD: I think Dr. Stainken's  
7 presentation -- we agree; you are right. What I  
8 would propose is that rather than the SCVIR  
9 technology forum that works with the FDA, that a  
10 multi-disciplinary group be put together of  
11 vascular specialists, including vascular surgeons,  
12 radiologists, interventional radiologists and  
13 vascular-oriented cardiologists that could serve in  
14 an advisory capacity to the FDA in some fashion to  
15 help develop OPCs and work with the FDA to propose  
16 trial design.

17 DR. TRACY: One more.

18 DR. STAINKEN: Just to close and conclude,  
19 I would suggest that perhaps the forum that exist  
20 and is not working might still be the vehicle;  
21 simply invite more people to participate. Thank  
22 you.

23 DR. TRACY: Thank you, everybody, for your  
24 comments. We will take a very brief, three and a  
25 half minute, break and then we will resume with the

1 open committee discussion.

2 [Brief recess]

3 **Open Committee Discussion**

4 DR. TRACY: Could everyone please take  
5 their seats? This is the open committee discussion  
6 portion of this afternoon's meeting and we will  
7 jump directly to the abbreviated questions that the  
8 were asked of the panel.

9 Panel question number one was given our  
10 current understanding of stenting in the iliac  
11 artery following suboptimal angioplasty, please  
12 discuss the need for a randomized control trial to  
13 evaluate a new iliac stent system for a suboptimal  
14 indication.

15 I think the thing that has come through to  
16 me loud and clear throughout the day is that it is  
17 a similar problem that is seen in many other trials  
18 for any device really where you are always chasing  
19 after technology and, obviously, for this  
20 particular indication there are a number of stents  
21 that are being used that have not been subjected to  
22 comparison with angioplasty or with medical therapy  
23 or with surgical therapy and are really being used,  
24 I assume, without having an adequate registry to  
25 keep the information on the results of using those

1 stents. So, I think it is probably, at this point,  
2 not realistic to think that there could be a  
3 randomized control trial to evaluate a new iliac  
4 stent system because I am not sure against what it  
5 would be randomized. An off-use biliary stent or  
6 an adequate stent, surgery, medical therapy? I  
7 think it becomes a very difficult question, and I  
8 think it is very unfortunate because I am not  
9 convinced that the results of stenting are any  
10 better than a little medical therapy and stopping  
11 smoking, and I just think that we have lost the  
12 opportunity to know that at this point in time.

13 It is really a difficult thing when there  
14 is a very obvious desire for the physician to get a  
15 good result for their patient and to see that good  
16 immediate result and somehow equate that with a  
17 long-term result. I don't think it is fair to do  
18 that to the patient. It may be getting them out of  
19 the lab quickly and safely but it is not  
20 guaranteeing that they are going to be walking  
21 around in five years on that leg.

22 So, to take all that into account still, I  
23 think it is not possible to have a randomized  
24 trial, and I think my opinion would be that  
25 developing some type of OPC is probably reasonable.

1 Given that 90 percent of the creep that I have the  
2 sense would be taking place, how would you stop a  
3 person from saying, "oh, I failed; let me put in a  
4 stent at this point?" It turns out that 90 percent  
5 clinically are being done, if not intentionally  
6 with that endpoint, that seems to be clinically  
7 what is happening. So, the horse is out of the  
8 barn at this point in terms of going back to  
9 something randomized certainly for a suboptimal  
10 result. And, I am very worried about the idea of a  
11 randomized controlled trial for a primary iliac  
12 dilatation.

13 I don't know if anybody else can come up  
14 with anything more cogent than that, but I think  
15 the idea of people putting their heads together to  
16 come up with some type of OPC is probably a very  
17 good idea.

18 DR. FREISCHLAG: I did notice that a  
19 surgeon didn't talk, and I am not sure if we were  
20 asked and denied or not asked, but I want to make  
21 sure people know that there are a lot of vascular  
22 surgeons that do this intervention. Certainly, if  
23 you are going to have this forum to put heads  
24 together it has to be all three.

25 I think the one thing that surgeons may

1 understand a tad better is the vessels and that we  
2 have touched them. Not that that makes us special  
3 or better, it is just that when you touch a  
4 subclavian and sew to it, it is a whole lot  
5 different than an iliac. It is not the same. Even  
6 one subclavian to another patient isn't the same.  
7 So, I guess I plead that everyone is different.  
8 Certainly, for vascular surgeons the indication is  
9 so key. The pot is only so big in the next ten  
10 years to treat patients with vascular disease.  
11 There is no money out there. We all sort of  
12 figured that one out.

13           Therefore, if the pot is so inclusive to  
14 treat any lesion you see on an angiogram I think we  
15 are going to miss the point of the patients that  
16 need the intervention in order to have a better  
17 quality of life and in order to benefit from our  
18 intervention, no matter which stent we use. When  
19 you get a sick patient you may not be able to treat  
20 them because the pot is empty come the end of the  
21 year. That sounds a little strange but I see it  
22 happening in California where there is only so much  
23 they are allowing us to do and, certainly, follow-  
24 up is a really bad problem in California. They  
25 don't let them come back to see you for fear you

1 might find something wrong and you might do  
2 something else. So, I think follow-up is the most  
3 key thing here. We learned that this morning, if  
4 you are going to decide something is better than  
5 something else. I had a patient with two stents  
6 that just went down Friday, and she was 18 months  
7 out. So, just looking at 30 days or six months, I  
8 don't think will answer those questions.

9 I think it is a great idea to get all the  
10 specialists together that want to treat this and to  
11 look at the new technology to try to grab a hold of  
12 it, and perhaps compare technologies to each other,  
13 even though it is not something we have done  
14 before. We have tried to avoid that. I think that  
15 with good follow-up and good indications it would  
16 be great.

17 Then, one more little rah for surgery,  
18 surgery has changed too in the last ten years. We  
19 do things and our morbidity and mortality is much  
20 lower than it has ever been. Our length of stays  
21 for aortas at UCLA is 2.7 days; our carotids are  
22 0.9 days. So, surgery has a different ambiance  
23 also that perhaps needs to be put into the  
24 equation.

25 DR. SIMMONS: I appreciate Dr. Zipes'

1 letter and I do agree that it is a very similar  
2 situation to radio frequency ablation and that  
3 everybody is doing it. But I think there are  
4 differences that have been pointed out here. That  
5 is, with radio frequency ablation it was pretty  
6 much a black and white issue. Either they had the  
7 arrhythmia or they didn't have it, and it was there  
8 or it wasn't there and that is why it was so good.  
9 But I think this is a little greyer here. I mean,  
10 everybody is doing it and they say that this is so  
11 much better than whatever is out there but, yet,  
12 nobody has ever done the trials to show that it is  
13 better than what is out there. The thing is there  
14 are other things out there to treat this. I don't  
15 know, I think it is a different situation.

16           Fortunately, having been here a few years,  
17 I recognize the FDA doesn't have the power to  
18 enforce a randomized trial. They just don't have  
19 that power and we have to live in the practical  
20 world, and if everyone is going to do it and they  
21 are not going to enroll patients in the  
22 unattractive clinical alternative, your OPC may be  
23 your only alternative.

24           MR. DILLARD: If I could just make a  
25 comment on that, I guess I wouldn't characterize it

1 as not having the power to force somebody to do a  
2 randomized controlled clinical trial. I think we  
3 have a little bit different focus, which is trying  
4 to focus on the right trial to get the right  
5 answers. If the right trial to get the right  
6 answers is a randomized, concurrently controlled  
7 clinical trial then, in fact, we will ask for that,  
8 knowing that we ultimately have to make the  
9 decision whether something should be on the market  
10 or not.

11 I think that what has become apparent to  
12 all of us, including us at the FDA, is that we need  
13 to have a flexible approach to learning in the  
14 clinical arena, and once we start understanding  
15 about a technology perhaps it is time to take a  
16 look at the type of clinical trial that we need to  
17 answer subsequent questions either on similar  
18 technology or on next generation technology.

19 So, one of the things that I think we are  
20 kind of asking in all these questions, and I don't  
21 mean to put Dr. Wittes on the spot here, but  
22 perhaps she has some comments, and others, on what  
23 do we do as products start becoming standard of  
24 care when, in fact, the approval lags for whatever  
25 reason, you know, partially pointing the finger at

1 the FDA but maybe partially at clinical trials  
2 and/or how quickly clinical thought evolves. What  
3 is it that we can do to try to keep up with that to  
4 help design the right trials, and when do we make  
5 the decision to change? What are some of the  
6 guidelines for that? So, I only pose that not to  
7 derail but I think that is really the over-arching  
8 piece outcome all of our questions.

9 DR. WITTES: This is a hard thing for me  
10 to answer. I, obviously, feel uncomfortable coming  
11 on board on a statement that says just because the  
12 train is on the track doesn't mean we don't need to  
13 ask the question about efficacy, which seems to me  
14 is saying yes to this question. On the other hand,  
15 when trains are on the track, you know, it is hard  
16 -- obviously you can't do the naive trial again.  
17 And, I am just really reiterating what you are  
18 saying which is that there are different trials and  
19 different designs for different questions, and a  
20 blanket statement that from now on a trial is not  
21 needed seems wrong to me, even though it is hard to  
22 imagine in the abstraction what question would be  
23 asked by what trial.

24 There are registries in other areas where  
25 I think a lot of information has been learned, and

1 maybe this is a place to think about registries and  
2 clinical outcomes that make sense with long-term  
3 follow-up. In so doing, there may in fact come out  
4 to be questions that can be answered, that  
5 manufacturers will want answered by a clinical  
6 trial. I mean, they may say, my goodness, my  
7 device is better in such-and-such an area. It  
8 seems to me that the plate needs to be open and  
9 there need to be strategies for approval that don't  
10 include trials. The situation now sounds like  
11 everybody is using the devices anyhow.

12 But when I hear that we are talking about  
13 300,000 stents of these types to be used in the  
14 next few years, it just sounds to me -- I can't  
15 really believe that there aren't any rigorous  
16 questions to ask of that at least for subsets of  
17 the devices and for subsets of questions to be  
18 asked. So, that is my comment.

19 DR. TRACY: I think it is a very difficult  
20 situation when you have of those 300,000 procedures  
21 being performed and the overwhelming majority are  
22 being done off-label. So, to try to enforce any  
23 type of registry on that seems difficult, but maybe  
24 something voluntary would be appropriate if it is  
25 at all possible to institute something like that

1 because it does not make sense to compare with an  
2 antiquated device, which just shows how quickly the  
3 technology is moving along. But there will always  
4 be people with equally extensive disease who would  
5 prefer surgery or who would prefer medical therapy  
6 and somehow information needs to be captured on  
7 those people because anything that we have seen  
8 either presented today or in the referred data has  
9 not shown, to me, superiority to plain angioplasty.  
10 Certainly, I am not totally convinced that it is  
11 superior to medical therapy, nor am I convinced at  
12 all that it is superior to surgical therapy. So,  
13 we have to remember that, that we don't know these  
14 endpoints. We don't know.

15 DR. NAJARIAN: I just have a question. Is  
16 it our job I guess as the FDA to decide whether  
17 something is as effective as something else, or if  
18 one therapy should be used versus another, or if a  
19 given therapy is safe? That, I guess, is the  
20 dilemma that I am in.

21 MR. DILLARD: Let me comment on that  
22 because even with the passage of the Food and Drug  
23 Administration Modernization Act of 1997, a number  
24 of things changed. The one thing that did not  
25 change in either the standard of 510(k) or

1 premarket approval application, either one, was  
2 that safety and effectiveness in terms of the  
3 language are still in both of those processes. So,  
4 under the 510(k) we still have to determine that a  
5 product is as safe and as effective as a product  
6 that is on the market. And, the PMA standard is  
7 still that the product has to be proven to have  
8 reasonable assurance of safety and effectiveness.

9         So, I think pulling effectiveness out of  
10 the equation at this point is not only dangerous  
11 but something that we can't do. So, I think we  
12 still need to have that focus, and it is an  
13 important focus, on both of those components when  
14 we design our clinical trials.

15         DR. TRACY: I think what you said is very  
16 important, that it doesn't have to necessarily be  
17 more effective.

18         MR. DILLARD: Correct.

19         DR. TRACY: The other issue in a device  
20 such as this is there may be the acute safety but  
21 then there is the long-term safety, things that are  
22 not defined, captured or even looked at in the  
23 short-term trials that I always worry about.

24         DR. AZIZ: I think, clearly, randomized  
25 trials are the way to go, but I think, as we have

1 seen, there are devices that are already being  
2 used. In my mind, it is what is the control group  
3 that you are really going to compare it against  
4 whether it is a randomized trial or whether it is a  
5 retrospective trial. I think the problem that one  
6 has to battle with clearly is what are you going to  
7 use as a control group.

8 Even though it is a moving target and new  
9 technology may come out tomorrow, I think the  
10 safety and efficacy will obviously be demonstrated,  
11 but at least in my mind, and probably in the  
12 company's mind and also from a lot of the  
13 interventionists, the device they produce has to be  
14 tested against something, and if you have a  
15 randomized trial and you can't have a control group  
16 you are really not doing anything. I think  
17 probably, by the nature of the way that practice is  
18 being done, it has to be compared to something else  
19 unless you just say let them use control groups and  
20 I think some devices have been passed where they  
21 just looked at control groups.

22 So, I think the train really is moving on,  
23 and I think a lot of interventionists are going to  
24 be using the devices off-label. It is hard to get  
25 things that are good out there quickly without

1 actually impeding progress. A case in point would  
2 be the thoracic aneurism and traumatic aortic tears  
3 where surgery is the standard of care. We have  
4 done a few cases where we put the endovascular  
5 stents off-label and the patients have done really  
6 well. These are isolated case reports.

7 I think we have to grapple with how can we  
8 get good things to the patients without actually  
9 necessarily focusing too much on the niceties of  
10 having a randomized, controlled trial. Is it safe?  
11 Is it effective? In many cases some of these  
12 things are needed, particularly in the thoracic  
13 stent area, which at the moment, from what I see,  
14 is really grappling to get those devices out for  
15 acute type B dissections, for traumatic aortic  
16 tears. I think for some reason we are impeding  
17 progress. We know that these patients don't  
18 necessarily always benefit well from surgery type B  
19 dissections. I can tell you they are very  
20 difficult cases to operate on. I think traumatic  
21 aortic tears, a lot of the patients we do -- not  
22 that you can't sew it in half an hour, but these  
23 are guys who have contusions, have head injuries,  
24 and I think I would rather some interventionist go  
25 in and put a stent in. In fact, I think that would

1 do the patient good.

2           So, in my own mind, I personally think  
3 that in some of these areas to request or demand a  
4 randomized trial may not be the right way to go,  
5 and I think there is nothing wrong with that.  
6 Although it is scientific purity, I think it won't  
7 be a practical necessity.

8           DR. TRACY: That is a very good comment.  
9 The other additional thing is that whatever vehicle  
10 is being used to compare, there has to be  
11 recognition of what is that vehicle and how are  
12 things changing clinically to try to keep current  
13 with the thinking in disease management, which  
14 means that these registries that we are sort of  
15 loosely talking about have to be very structured,  
16 and have to be prospectively organized. Part of  
17 the trouble we saw today was trying to look at  
18 something retrospectively but setting it up  
19 prospectively to gain the information that we  
20 really need to follow the safety and effectiveness  
21 of these devices over time.

22           DR. AZIZ: I think the focus should be  
23 that these gadgets or these devices are not doing  
24 any harm. I can tell you just from personal  
25 knowledge Chris White and a number of his

1 colleagues at Ochsner have done some very  
2 innovative things. Chris can correct me if I am  
3 wrong, cases with patients crescendo and TIAs where  
4 the neurosurgeons didn't want to operate on those  
5 patients, but I think they took a risk among  
6 themselves and put stents in and the patient didn't  
7 develop a stroke. I, for one, was fairly impressed  
8 when I heard things of that nature.

9           So, I think we mustn't impede progress for  
10 the sake of scientific data collection as, for  
11 example, the cases they have done haven't  
12 precipitated a stroke. That information should be  
13 in the registry.

14           DR. WITTES: I would like to make a point.  
15 I guess I am never convinced by the argument that  
16 says something doesn't do any harm. I mean, we  
17 want more than that.

18           MR. DILLARD: Your comments pretty well  
19 address number one and two for our questions.

20           DR. TRACY: Okay. Then, panel question  
21 three, stenting in occluded iliac arteries, please  
22 discuss the adequacy of a registry trial design, a  
23 historic control or objective performance criteria.  
24 That is 3a.

25           3b, please comment on trial endpoints and

1 the appropriate length of study follow-up for these  
2 patients.

3 Total silence! Since I think we don't  
4 have different information to work on for occluded  
5 versus highly stenotic, at this point I think that  
6 the same types of concerns would be present for  
7 either of them. As far as appropriate length of  
8 study follow-up for these patients, since their co-  
9 morbid conditions also limit their survival, I  
10 think there is going to be some natural limit to  
11 the amount of time that you can follow these  
12 people. But, I think that could be somehow  
13 statistically evaluated -- how long these people  
14 survive and is it likely that you would run out of  
15 benefit from the procedure -- I think that could be  
16 a derived number somehow. Any other comments?

17 DR. FREISCHLAG: There is a registry that  
18 has been developed for the endografts through the  
19 vascular societies and it has been extremely  
20 successful in trailing these patients. Even with  
21 the endografts, even though it sounds like that  
22 would be a better treatment, it shows that their  
23 survival is about the same as open surgery and  
24 about 25 percent of those patients die in five  
25 years. So, if you can follow five years in these

1 patients, with the natural history, 60-70 percent  
2 of them will be alive but 30-40 percent will not.  
3 So, I think we could get some benefit from using  
4 that registry. We actually pulled it out for a VA  
5 trial we are going to do with endografts to use the  
6 same registry. So, there are some of those  
7 registries out there to take a look at.

8 DR. TRACY: Other comments or questions?  
9 No? Panel question four, primary stenting in iliac  
10 arteries, please discuss the following points  
11 regarding trial design for a primary stent  
12 indication: randomized trial; control; superiority  
13 versus equivalence and endpoints.

14 I think we have really touched on most of  
15 these points already in the discussion of the other  
16 diseases. Anybody have any additional point that  
17 would deal primarily with primary stenting? Same  
18 concerns? Okay.

19 Panel question number five, primary  
20 stenting in iliac arteries, do you have any other  
21 recommendations regarding the trial design for a  
22 primary stent indication in the iliac artery?

23 I don't think there is anything in  
24 addition to add. It is just that I think we all  
25 recognize the difficulty in setting up this study,

1 but one thing I would like to emphasize is that  
2 follow-up is very, very critical for any of these  
3 things that we have been talking about.

4 DR. ROBERTS: One of the things that I  
5 guess I would like to recommend perhaps in terms of  
6 this is that one thing that could be considered is  
7 to really look at this in terms of kind of what  
8 matters to the patient, which is primarily patency,  
9 and then to, as best as possible, develop very  
10 objective ways of looking at this. And, one of the  
11 things that I would recommend not doing is using  
12 duplex ultrasound of the iliacs as an endpoint.  
13 You know, it is very hard to do. It is hard to get  
14 accurate data in that kind of case, and it is  
15 probably better to use something like a pulse  
16 volume recorder. It is probably not ankle-brachial  
17 indices; it is probably something like a pulse  
18 volume recorder looking at the pressure both  
19 before, immediately after and then, in terms of  
20 follow-up for whether or not this artery is open  
21 and whether or not you still have flow through the  
22 iliac system, separating that out from the distal  
23 vasculature because, you know, a number of these  
24 patients will have distal disease as well as iliac  
25 disease and that starts confounding things.

1           The other thing is that, as we have found  
2 today, I think that to the extent that we can, we  
3 need to try and find ways around having to bring  
4 these patients back for angiography. We need to  
5 try, as best we can. I think this is one of the  
6 problems that we get into with the various stent  
7 trials. It is very expensive to bring a patient  
8 back for an angiogram, particularly when the  
9 patient feels fine. We heard that today, that it  
10 is very difficult to do that. So, I think to the  
11 extent that we can, we need to find some sort of  
12 surrogate endpoints for angiographic follow-up. I  
13 would submit that something like a pulse volume  
14 recording would be a very good way to follow that.

15           DR. TRACY: Any additional comments? Any  
16 other questions from the FDA?

17           MR. DILLARD: Actually, one more if you  
18 wouldn't mind taking a couple of minutes, because  
19 what I think I am hearing a little bit is maybe  
20 partially what we have come to you all with two or  
21 three times lately about sort of some generic  
22 issues, and I am hearing a lot of the same thing,  
23 and I just want to make sure. If I am hearing this  
24 similarly, I can sort of factor it in to other  
25 sorts of trials and some of the other areas that we

1 are dealing with, and maybe not have to bring each  
2 one of them to you to necessarily put out on the  
3 table. But it sounds like we have a movement afoot  
4 to move from the old standby, which is the answer  
5 is randomized, currently controlled clinical trial  
6 under all circumstances unless we can do something  
7 that really is going to satisfy the clinical and/or  
8 the FDA to be able to really come to, which is the  
9 knowledge base is increasing and we can look  
10 towards other clinical trial designs. I hear a  
11 move a little bit from the panel -- maybe I am not  
12 hearing it correctly -- that it is appropriate and  
13 we should take a balanced look at clinical trial  
14 design, take a look at individual situations, and  
15 that sometimes it is going to call for a  
16 randomized, concurrently controlled clinical trial  
17 but other times perhaps registries under a similar  
18 kind of scenario would be appropriate, number one.

19           Number two, and I think this is the point  
20 I just want to kind of turn back on you in terms of  
21 a question, which is as these trials perhaps come  
22 to fruition with either newer devices, number one,  
23 or some fairly major second or third generation  
24 devices that we may be bringing back to you for a  
25 recommendation, that there is going to be sort of

1 an overall acceptance for other than just  
2 randomized, concurrently controlled clinical trial  
3 designs in order to be factored into decision-  
4 making processes. I just want to sort of put that  
5 out, not for a lot of discussion, but that is kind  
6 of some of the carry-home for me, to say that there  
7 is going to be a willingness on your part also to  
8 not only work with us on trial design but perhaps  
9 have broad basic acceptance of other than  
10 randomized, concurrently controlled clinical trial  
11 designs.

12 DR. TRACY: I think I probably speak for  
13 the group in saying that if the data that is  
14 brought to us is convincing and is something that  
15 we can analyze and get an idea is this thing safe;  
16 is this thing effective, then that is what we need  
17 to have. When we are presented with data that is  
18 somehow incomplete, or there is so much missing, or  
19 this trial design was so complicated it couldn't be  
20 accomplished, even if it theoretically was the  
21 purest design it becomes much more difficult to  
22 deal with. So, I think you would have our  
23 cooperation in accepting other than randomized,  
24 controlled trials if that were the appropriate  
25 design.

1 MR. DILLARD: Great.

2 DR. WITTES: But let me add that very  
3 often people think these other designs are easy.  
4 They are actually extremely difficult because you  
5 don't have the protection of the randomized. So,  
6 if you do these kinds of studies, they have to be  
7 absolutely meticulous so that you can, in fact,  
8 make comparisons that you need to make. Otherwise,  
9 the data become uninterpretable.

10 DR. LASKEY: It is the old story, "what's  
11 the question?" I think you really need to go back  
12 and that is where it all starts and ends. If you  
13 have a good question and it is appropriately  
14 pointed, you can usually design a study or  
15 hopefully you can to answer that. If the question  
16 is fuzzy, then you get into trouble.

17 That is why I think it is important to  
18 distinguish the utility of registry and an  
19 observational series from the RCTs. I think it  
20 really is very much a question of what you want to  
21 find out. So, it is easy enough to look at a  
22 consecutive series of acute and threatened closure  
23 in a registry and compare that to some database of  
24 thousands of cases of iliac stenting. That you can  
25 do. But if you are looking for a decided advantage

1 for treatment A versus treatment B in a disease  
2 which has a number of other confounding variables,  
3 unless you do the perfect registry, which I am not  
4 aware of, you are going to have confounding and you  
5 will wind up with all sorts of issues. In that  
6 instance, when you are looking for long-term  
7 follow-up, perhaps the RTC is the best way to go  
8 but, again, it is the question. What is the  
9 question? If it has a finite variable as an  
10 endpoint you are in good shape but if it is a mess,  
11 a composite endpoint of soft and hard variables,  
12 and that is often what we deal with -- we deal with  
13 that in the stent arena and it is not going to be  
14 any different in the peripheral intervention arena.

15 DR. ROBERTS: I don't know how you do  
16 this, but I think it is quite clear that if you can  
17 do a good randomized, controlled trial that  
18 obviously you get a lot more information and you  
19 feel much more comfortable with what the answers  
20 are. It almost is that there needs to be an  
21 incentive for doing that. In other words, it buys  
22 you something. I don't know what the answer to  
23 that would be, but it is almost as if somehow you  
24 get extra points, or it makes it easier, or  
25 something happens because you really do take the

1 time to do that kind of trial. Granted, when you  
2 do that kind of trial it should buy you something  
3 because it should be cleaner data. But it is  
4 almost like we need to think of a way to  
5 incentivize that.

6 MR. DILLARD: I might just make one  
7 comment on that point, and then I will be quiet and  
8 make one final comment. In the past many of the  
9 randomized, controlled trials that have come out to  
10 be successful, and let me just take one particular  
11 situation, the superiority trial, many times that  
12 does buy them something by way of a claim, whereas  
13 if we have a non-randomized, controlled trial, even  
14 though it is designed to be a superiority study,  
15 many times it does not end up in the types of  
16 claims that you would otherwise get from a  
17 randomized, controlled trial. So, actually in  
18 terms of FDA incentive, there has been some, albeit  
19 I won't say generically across the board. So,  
20 there are cases where it has ended up in a better  
21 claim, which I think we have heard from companies  
22 helps them in terms of marketability of their  
23 product in many cases. In many cases to you all  
24 was the users, having a randomized, controlled  
25 trial versus a competitor sometimes helps you make

1 a decision about which product to buy. So, that  
2 has been the incentive that we have heard.

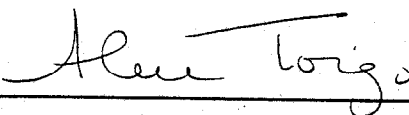

3 I will just make one final comment, number  
4 one, just to thank all of you. I think we are kind  
5 of winding down here and I want to thank you all  
6 for your effort today, number one, and number two,  
7 for letting FDA take the time to make sure that we,  
8 at least from a process standpoint, we are trying  
9 to do the best job that we could and so I apologize  
10 and I thank everybody both in the audience and the  
11 panel for bearing with us as we clarified some of  
12 that, and we will try to do a better job next time.

13 DR. TRACY: All right, we will adjourn the  
14 open session. Thank you, everybody.

15 [Whereupon, at 5:05 p.m. the proceedings  
16 were adjourned]
